

**Amendments to the Claims**

The following listing of claims replaces all prior versions of the claims and all prior listings of the claims in the present application.

C12  
Claims 1-30 (canceled)

Claim 31 (currently amended): A tyre for a four-wheeled vehicle ~~wheel~~, comprising:  
a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves; and

at least one third row of grooves;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of the tyre to predetermined distances from the equatorial plane of the tyre,

wherein all of the grooves are separate from one another so as to produce a pattern with no intercommunicating paths between the grooves,

wherein ends of the grooves of the at least one third row are far from the shoulder ends of the tyre,

wherein end portions of the grooves of the at least one third row extend outside a footprint of the tyre, and

wherein a greater dimension of each of the grooves of the at least one third row relative to a length of the tyre footprint allow water drainage from underneath the tyre footprint.

Claim 32 (previously presented): The tyre of claim 31, wherein a maximum distance between two points of each groove of the at least one third row, measured in a circumferential direction, is greater than a length of the tyre footprint when the tyre is inflated to nominal operating pressure and subjected to nominal load under static conditions.

Claim 33 (previously presented): The tyre of claim 31, wherein each groove of the at least one third row comprises a substantially-straight portion extending, at a predetermined inclination angle with respect to the equatorial plane of the tyre, between a first end, far from a first shoulder end of the tyre, and a second end, far from a second shoulder end of the tyre.

Claim 34 (currently amended): The A tyre of claim 33 for a vehicle wheel, comprising:  
a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre.

wherein the shoulder ends of the tyre are axially opposite one another relative to an equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves; and

at least one third row of grooves;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of the tyre to predetermined distances from the equatorial plane of the tyre,

wherein all of the grooves are separate from one another so as to produce a pattern with no intercommunicating paths between the grooves,

wherein ends of the grooves of the at least one third row are far from the shoulder ends of the tyre,

wherein end portions of the grooves of the at least one third row extend outside a footprint of the tyre,

wherein a greater dimension of each of the grooves of the at least one third row relative to a length of the tyre footprint allow water drainage from underneath the tyre footprint,

wherein each groove of the at least one third row comprises a substantially-straight portion extending, at a predetermined inclination angle with respect to the equatorial plane of the tyre, between a first end, far from a first shoulder end of the tyre, and a second end, far from a second shoulder end of the tyre, and

wherein the grooves of the at least one third row comprise two end portions of the substantially-straight portion shaped according to curved arcs having opposite curvatures to one another.

C12  
Claim 35 (currently amended): The A tyre of claim 31 for a vehicle wheel, comprising:  
a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves; and

at least one third row of grooves;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of the tyre to predetermined distances from the equatorial plane of the tyre,

wherein all of the grooves are separate from one another so as to produce a pattern with no intercommunicating paths between the grooves,

wherein ends of the grooves of the at least one third row are far from the shoulder ends of the tyre,

wherein end portions of the grooves of the at least one third row extend outside a footprint of the tyre,

wherein a greater dimension of each of the grooves of the at least one third row relative to a length of the tyre footprint allow water drainage from underneath the tyre footprint, and

wherein the grooves of a first lateral row comprise a form different from the grooves of a second lateral row.

Claim 36 (previously presented): The tyre of claim 31, wherein each groove of a first lateral row:

starts from a first shoulder end of the tyre; and

ends in a first straight portion forming an acute angle having a predetermined value with respect to the equatorial plane of the tyre;

wherein the first straight portion comprises a direction opposite to that of a second straight portion of each groove of a second lateral row with respect to the equatorial plane of the tyre.

Claim 37 (previously presented): The tyre of claim 31, wherein the grooves of a first lateral row extend from a shoulder end of the tyre with inclinations comprising, with respect to the equatorial plane of the tyre, a direction opposite to that of the grooves of a second lateral row.

Claim 38 (currently amended): The A tyre of claim 31 for a vehicle wheel, further comprising:

a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves;

at least one third row of grooves; and

a fourth row of grooves circumferentially spaced from one another;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of the tyre to predetermined distances from the equatorial plane of the tyre,

wherein all of the grooves are separate from one another so as to produce a pattern with no intercommunicating paths between the grooves,

wherein ends of the grooves of the at least one third row are far from the shoulder ends of the tyre,

wherein end portions of the grooves of the at least one third row extend outside a footprint of the tyre,

wherein a greater dimension of each of the grooves of the at least one third row relative to a length of the tyre footprint allow water drainage from underneath the tyre footprint,

wherein the fourth row of grooves ~~[[are]]~~ is separate from the lateral rows of grooves and the at least one third row of grooves,

wherein the grooves of the fourth row start from a shoulder end of the tyre, between two adjacent grooves of a first lateral row, and

wherein the grooves of the fourth row end between two adjacent grooves of the at least one third row.

C12  
Claim 39 (previously presented): The tyre of claim 38, wherein:

the grooves of the first lateral row and the grooves of the at least one third row form first trajectories;

the grooves of the fourth row and the grooves of a second lateral row form second trajectories;

the first and second trajectories alternate with one another;

the first and second trajectories are circumferentially spaced;

the first and second trajectories comprise a substantially-undulating shape with peaks aligned on a circumferential plane parallel to the equatorial plane of the tyre;

the first trajectories comprise an interruption between the grooves of the first lateral row and the grooves of the at least one third row; and

the second trajectories comprise an interruption between the grooves of the fourth row and the grooves of the second lateral row.

Claim 40 (previously presented): The tyre of claim 31, further comprising:

CP2

a fifth row of grooves arranged between the lateral rows;  
wherein the grooves of the fifth row are circumferentially spaced from one another,  
wherein the grooves of the fifth row are separate from those of the lateral rows of grooves  
and the at least one third row of grooves, and  
wherein the at least one third row of grooves and the fifth row of grooves are symmetrical  
with one another relative to the equatorial plane of the tyre.

Claim 41 (currently amended): A tyre for a four-wheeled vehicle ~~wheel~~, comprising:

a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an  
equatorial plane of the tyre, and

wherein the tread pattern comprises:

multiple rows of grooves;

wherein, within at least one internal row of the grooves, the grooves are circumferentially  
spaced from one another,

wherein the at least one internal row of grooves comprises means for acoustically  
signalling an air pressure value lower than a predefined limit,

FINNEGAN  
HENDERSON  
FARABOW  
GARRETT &  
DUNNER LLP

1300 I Street, NW  
Washington, DC 20005

Fax 202.408.4400  
www.finnegan.com

wherein the means requires a first dimension, in a direction of travel, of one or more grooves of the at least one internal row to be greater than a second dimension of a footprint of the tyre in a same direction,

wherein the first and second dimensions are measured with the tyre inflated at nominal operating pressure and subjected to nominal load under static conditions, [[and]]

wherein, in case of pressure values lower than the predefined limit, the second dimension assumes a quantity at least equal to the first dimension,

wherein, in the case of pressure values lower than the predefined limit, a relationship between the second and first dimensions causes air retention in the one or more grooves of the at least one internal row inside the tyre footprint during contact with the ground, and

wherein, in the case of pressure values lower than the predefined limit, the relationship between the second and first dimensions causes instantaneous expulsion of at least some of the air when at least one portion of the one or more grooves of the at least one internal row pass outside the tyre footprint.

Claim 42 (previously presented): A method for checking a value of air pressure inside a tyre for a vehicle wheel, comprising:

forming, between two axially-opposite shoulder ends of a tread pattern of a tread band of the tyre, at least one row of grooves circumferentially spaced from one another;

assigning to at least several successive grooves of the at least one row at least one first dimension greater than a second dimension of a tyre footprint under inflation conditions and nominal load;

www.finnegan.com

checking, under static load conditions with a tyre air pressure below a predefined value, whether the at least one first dimension is suitable for allowing enclosure of air underneath the tyre footprint and expulsion of at least some of the air with noise outside the tyre footprint; and

if an outcome of the checking is negative, modifying the at least one first dimension and a number of grooves of the at least several successive grooves until an acoustic signal is produced indicating a lower air pressure inside the tyre.

CR  
Claim 43 (currently amended): ~~An acoustic signaling device~~ A tyre for a four-wheeled vehicle wheel, comprising:

several groups of grooves in a tread pattern of ~~[[a]] the tyre of the vehicle wheel~~;

wherein at least one axially-internal row of grooves comprises a plurality of grooves circumferentially spaced from one another,

wherein one or more predetermined grooves of the at least one axially-internal row comprise~~[[:]] a first dimension of a footprint of the tyre,~~

wherein, at nominal tyre air pressure and under static load, the first dimension is greater than a second dimension of [[the]] a footprint of the tyre measured at nominal tyre air pressure under static load, and

wherein, with tyre air pressure lower than a predefined limit, the first dimension smaller is less than or equal to the second dimension, measured with tyre air pressure lower than a predefined limit generating acoustic signals.

Claim 44 (canceled)

Claim 45 (previously presented): A method for indicating a reduction in an inflation pressure of a tyre comprising a tread pattern, comprising:

varying a noise level of the tread pattern upon variation of the inflation pressure of the tyre.

C12  
Claim 46 (new): The tyre of claim 43, wherein the acoustic signals are generated by enclosure of air in the one or more predetermined grooves underneath a footprint of the tyre and expulsion of at least some of the air, with noise, when the one or more predetermined grooves are no longer completely underneath the footprint of the tyre.

Claim 47 (new): A tyre for a vehicle wheel, comprising:

a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves; and

at least one third row of grooves;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of the tyre to predetermined distances from the equatorial plane of the tyre,

wherein all of the grooves are separate from one another so as to produce a pattern with no intercommunicating paths between the grooves,

C12  
wherein ends of the grooves of the at least one third row are far from the shoulder ends of the tyre,

wherein end portions of the grooves of the at least one third row extend outside a footprint of the tyre,

wherein a greater dimension of each of the grooves of the at least one third row relative to a length of the tyre footprint allow water drainage from underneath the tyre footprint, and

wherein paths exist along a rolling surface of the tread pattern from a first shoulder end of the tyre to a second shoulder end of the tyre without crossing any of the grooves.

Claim 48 (new): The tyre of claim 47, wherein a maximum distance between two points of each groove of the at least one third row, measured in a circumferential direction, is greater than a length of the tyre footprint when the tyre is inflated to nominal operating pressure and subjected to nominal load under static conditions.

Claim 49 (new): The tyre of claim 47, wherein each groove of the at least one third row comprises a substantially-straight portion extending, at a predetermined inclination angle with respect to the equatorial plane of the tyre, between a first end, far from the first shoulder end of the tyre, and a second end, far from the second shoulder end of the tyre.

Claim 50 (new): The tyre of claim 49, wherein the grooves of the at least one third row comprise two end portions of the substantially-straight portion shaped according to curved arcs having opposite curvatures to one another.

C12  
Claim 51 (new): The tyre of claim 47, wherein the grooves of a first lateral row comprise a form different from the grooves of a second lateral row.

Claim 52 (new): The tyre of claim 47, wherein each groove of a first lateral row:  
starts from the first shoulder end of the tyre; and  
ends in a first straight portion forming an acute angle having a predetermined value with respect to the equatorial plane of the tyre;

wherein the first straight portion comprises a direction opposite to that of a second straight portion of each groove of a second lateral row with respect to the equatorial plane of the tyre.

Claim 53 (new): The tyre of claim 47, wherein the grooves of a first lateral row extend from the first shoulder end of the tyre with inclinations comprising, with respect to the equatorial plane of the tyre, a direction opposite to that of the grooves of a second lateral row.

Claim 54 (new): The tyre of claim 47, further comprising:  
a fourth row of grooves circumferentially spaced from one another;

FINNEGAN  
HENDERSON

wherein the fourth row of grooves is separate from the lateral rows of grooves and the at least one third row of grooves,

wherein the grooves of the fourth row start from the first shoulder end of the tyre, between two adjacent grooves of a first lateral row, and

C12 wherein the grooves of the fourth row end between two adjacent grooves of the at least one third row.

Claim 55 (new): The tyre of claim 54, wherein:

the grooves of the first lateral row and the grooves of the at least one third row form first trajectories;

the grooves of the fourth row and the grooves of a second lateral row form second trajectories;

the first and second trajectories alternate with one another;

the first and second trajectories are circumferentially spaced;

the first and second trajectories comprise a substantially-undulating shape with peaks aligned on a circumferential plane parallel to the equatorial plane of the tyre;

the first trajectories comprise an interruption between the grooves of the first lateral row and the grooves of the at least one third row; and

the second trajectories comprise an interruption between the grooves of the fourth row and the grooves of the second lateral row.

Claim 56 (new): The tyre of claim 47, further comprising:

a fifth row of grooves arranged between the lateral rows;  
wherein the grooves of the fifth row are circumferentially spaced from one another,  
wherein the grooves of the fifth row are separate from those of the lateral rows of grooves  
and the at least one third row of grooves, and  
wherein the at least one third row of grooves and the fifth row of grooves are symmetrical  
with one another relative to the equatorial plane of the tyre.

Claim 57 (new): A tyre for a vehicle wheel, comprising:

a tread band;

wherein the tread band comprises:

a tread pattern;

wherein the tread pattern is defined between two shoulder ends of the tyre,

wherein the shoulder ends of the tyre are axially opposite one another relative to an  
equatorial plane of the tyre, and

wherein the tread pattern comprises:

two lateral rows of grooves;

at least one third row of grooves; and

no circumferential grooves;

wherein the at least one third row of grooves is arranged between the lateral rows,

wherein, within each row, the grooves are circumferentially spaced from one another,

wherein the grooves of the lateral rows axially extend from respective shoulder ends of

the tyre to predetermined distances from the equatorial plane of the tyre,

the grooves of the first lateral row and the grooves of the at least one third row form first trajectories;

the grooves of the fourth row and the grooves of a second lateral row form second trajectories;

the first and second trajectories alternate with one another;

the first and second trajectories are circumferentially spaced;

C12  
the first and second trajectories comprise a substantially-undulating shape with peaks aligned on a circumferential plane parallel to the equatorial plane of the tyre;

the first trajectories comprise an interruption between the grooves of the first lateral row and the grooves of the at least one third row; and

the second trajectories comprise an interruption between the grooves of the fourth row and the grooves of the second lateral row.

Claim 76 (new): The tyre of claim 67, further comprising:

a fifth row of grooves arranged between the lateral rows;

wherein the grooves of the fifth row are circumferentially spaced from one another,

wherein the grooves of the fifth row are separate from those of the lateral rows of grooves and the at least one third row of grooves, and

wherein the at least one third row of grooves and the fifth row of grooves are symmetrical with one another relative to the equatorial plane of the tyre.
